

Phase 2 Deployment Guide

macOS setup

Run `python3 -m venv .venv`, `source .venv/bin/activate`, `pip install -r requirements.txt`, and `streamlit run src/app.py`.

Database

The SQLite database is created automatically. Delete `src/database/health_dashboard.db` and restart to reset demo data.

GitHub Desktop

Copy Phase 2 into the existing repository, review changes, commit with Phase 2 - Add four wellness modules, and select Push origin.

Troubleshooting

Activate the virtual environment for missing modules. Use `--server.port 8502` if needed. Reset the demo database after schema changes.
