

Phase 2 Developer Guide

Project flow

app.py initializes configuration, CSS, SQLite, repositories, and navigation. Each page receives a repository and renders forms, metrics, charts, history, and administrator controls.

Core classes

DatabaseManager; four record dataclasses; DomainRepository and concrete repositories; AnalyticsService; and five Streamlit page classes.

Adding metrics

Update schema.sql, the relevant dataclass, repository columns, Streamlit form, chart logic, and tests. Keep SQL out of page classes.

Testing

Run `python -m compileall src` and `pytest`, then complete the manual acceptance test in README.md.

Phase 1 integration

Replace the demo role and client selectors with values from the authenticated Phase 1 session.
